

Brain Test - App

End-to-End CI/CD pipeline deployment of Brain-Task-Application using AWS Devops Tools

Project Overview

The objective of this project was to build and deploy the Brain Task Application using a complete DevOps CI/CD pipeline on AWS. The application source code was maintained in GitHub, containerized using Docker, stored in Docker Hub, and automatically deployed to Amazon EKS through AWS CodePipeline and AWS CodeBuild. The application was exposed to end users through a Kubernetes LoadBalancer backed by an AWS Network Load Balancer.

Architecture

Technologies Used

- GitHub
- Docker
- Docker Hub
- AWS CodeBuild

- AWS CodePipeline
- Amazon EKS (Elastic Kubernetes Service)
- Kubernetes
- AWS IAM
- AWS CloudWatch
- AWS Network Load Balancer

1. Source Code Management

- Application source code was hosted in GitHub.
- Deployment and service manifests were maintained in the repository.
- CI/CD pipeline was triggered automatically on code commits.

2. Containerization

- Created a Dockerfile for the application.
- Built the Docker image locally.
- Tagged and pushed the image to Docker Hub.

Docker Repository: sivakumar1207/project-brain-task-app

3. Continuous Integration

- Created an AWS CodeBuild project.
- Configured buildspec.yml to:
 - Authenticate with Docker Hub
 - Build Docker images
 - Push images to Docker Hub

4. Kubernetes Deployment

- Created Amazon EKS Auto Mode Cluster.
- Configured Kubernetes Deployment with multiple replicas.
- Created Kubernetes LoadBalancer service.
- Deployed the application on Amazon EKS.

5. Continuous Deployment

- Created a second AWS CodeBuild project for EKS deployment.
- Configured deployment automation using kubectl commands.
- Integrated deployment stage into AWS CodePipeline.
- Configured IAM permissions and EKS access entries for automated deployment.

6. Load Balancer Configuration

- Exposed the application using Kubernetes Service of type LoadBalancer.
- Created an Internet-Facing AWS Network Load Balancer.
- Enabled public access to the application.

7. Monitoring

- CloudWatch Logs were enabled for Build and Deploy stages.
- Build execution and deployment activities were monitored through:
 - AWS CodeBuild Logs
 - AWS CodePipeline Execution History

○ Kubernetes Pods and Services

Cloning the git repository to ubuntu linux. Starting, enabling and status check of docker container.

```
ubuntu@ip-172-31-11-163:~$ git clone https://github.com/Siva-Kumar10/Brain-Tasks-App.git

Repository overview

An overview describes what your image does and how to run it. It displays in the public view of your repository once you have pushed some content.

Using 1 of 1 private repositories.

Docker commands

To push a new tag to this repository:

docker push sivakumar1207/project-brain-task-app:tagname

buildcloud

Build with Docker Build Cloud

Accelerate image build times with access to cloud-based builders and shared cache.

Docker Build Cloud executes builds on optimally-dimensioned cloud infrastructure with dedicated per-organization isolation.

Get faster builds through shared caching across your team, native multi-platform support, and encrypted data transfer - all without managing infrastructure.

Go to Docker Build Cloud

buildcloud

Build with Docker Build Cloud

Accelerate image build times with access to cloud-based builders and shared cache.

Docker Build Cloud executes builds on optimally-dimensioned cloud infrastructure with dedicated per-organization isolation.

Get faster builds through shared caching across your team, native multi-platform support, and encrypted data transfer - all without managing infrastructure.

Deploy-buildspec.yml

```
version: 0.2

phases:
  install:
    commands:
      - curl -LO "https://dl.k8s.io/release/v1.37.0/bin/linux/amd64/kubectl"
      - chmod +x kubectl
      - mv kubectl /usr/local/bin

  pre_build:
    commands:
      - aws eks update-kubeconfig --region ap-south-2 --name Brain-Task-App

  build:
    commands:
      - kubectl apply -f deployment.yml
      - kubectl apply -f service.yml

  post_build:
    commands:
      kubectl get pods
      kubectl get svc
```
